SPECIFICATION

FIELD NOTES

Wedges used for switch points should be such that when used, the wedge must be driven between the rail and the switch point's sufficient distance to ensure a safe wedge that prevents the wedge from being placed against the rail. The wedge should be driven to ensure that it is fully seated. The length may be adjusted to fit the needs of the switch point. To meet local conditions, the wedge may be taken to ensure that it adheres to the requirements of the switch point. The wedge should be seated to ensure a safe and secure installation. If the wedge is not fully seated, it should be removed and reinstalled.
